Capstone — Workplace AI Implementation

1. Target Task

Creating and improving presentation slides for work or project presentations.
This is a recurring task that requires organizing content, choosing a suitable visual structure, and refining the presentation design.

2. Previous AI Use & Result

Previously, I used AI by giving it a general request without a structured prompt.

Previous Prompt:

"I want to create a presentation and I want the slides to look very beautiful."

I then provided additional instructions asking AI to make the presentation modern, creative, professional, and visually appealing.

Previous AI Output:

The AI provided general presentation design suggestions, such as using a modern visual style, suitable images, animations, and a professional layout. However, the instructions were broad and did not clearly define the presentation structure or the exact expected result.

3. Improved AI Use — R.A.C.E.

After learning the R.A.C.E. framework, I structured my request using **Role, Action, Context, and Expectation**.

Improved Prompt:

Role: Act as a professional presentation designer and visual storytelling expert.

Action: Create a professional presentation structure and suggest a visual design for each slide based on the provided project content.

Context: The presentation is for presenting a project to an audience or evaluation committee. The content should remain clear, organized, and easy to understand.

Expectation: Create a modern, elegant, creative presentation with a consistent visual identity. Use natural Arabic, clear slide hierarchy, appropriate visuals, and engaging layouts. Avoid generic templates and make the presentation look professionally designed.

4. Data Masking

Before using AI, I removed any personal names, account IDs, and confidential organizational information that was not necessary for the presentation task.

Only the information needed to create the presentation structure and design was provided.

5. Iterative Refinement

Issue with the initial output:
The initial suggestions were useful but too general and did not provide a strong enough visual direction for the slides.

Follow-up Prompt:

"Improve the previous result without starting over. Make the slide design more visually distinctive and professional. Give each slide a clear visual concept, layout, and hierarchy while keeping the content concise. Maintain one consistent visual identity throughout the presentation."

6. Improved AI Output

The refined output provided a clearer presentation direction, including:

- A consistent visual identity across all slides.
- A clear structure for each slide.
- More creative and purposeful layouts.
- Better balance between text and visuals.
- Clear visual hierarchy.
- Concise content suitable for presentation.
- A professional and modern overall appearance.

The result was more specific and practical than the initial AI output and could be used as a clearer guide for building the final presentation.

7. Verification & Impact

I reviewed the AI-generated presentation suggestions against the original project content to ensure that the information and meaning were not changed.

I also checked that no personal or confidential information was included.

Arithmetic check: Not applicable because this task did not require calculations.

Estimated time saved: 10 minutes per presentation task.
